Pansiot encodings

### **Overview**

### Dejean's conjecture

### Output Description 10 Contract of the second sec

4 A N

Let  $\Sigma_n = \{0, 1, 2, \dots, n-1\}$ . Consider an infinite square-free word

$$\mathbf{w} = a_0 a_1 a_2 a_3 a_4 a_5 \cdots$$

where the  $a_i \in \Sigma_3$ . The Pansiot encoding of **w** is the sequence

$$\pi(\mathbf{w}) = b_0 b_1 b_2 b_3 b_4 b_5 \cdots$$

where

$$b_i = \left\{ egin{array}{cc} 0, & a_i = a_{i+2} \ 1, & ext{otherwise} \end{array} 
ight.$$

 $\texttt{vtm} = \texttt{012021012102012021020121} \cdots$ 

The Pansiot encoding is in red:

vtm = 
$$\stackrel{1}{\overset{0}{\overset{0}{\uparrow}}} 12021012102012021020121\cdots$$

The Pansiot encoding is in red:

vtm = 
$$012021012102012021020121\cdots$$

The Pansiot encoding is in red:

$$\texttt{vtm} = \begin{matrix} 110\\ 012021012102012021020121 \cdots \\ \uparrow \uparrow \end{matrix}$$

The Pansiot encoding is in red:

```
\texttt{vtm} = \begin{array}{c} 1101 \\ 012021012102012021020121 \cdots \\ \uparrow \end{array}
```

The Pansiot encoding is in red:

```
\texttt{vtm} = \begin{matrix} 11011 \\ 012021012102012021020121 \cdots \\ \uparrow \uparrow \end{matrix}
```

The Pansiot encoding is in red:

```
\texttt{vtm} = \begin{array}{c} 110110 \\ 012021012102012021020121 \cdots \\ \uparrow \uparrow \end{array}
```

The Pansiot encoding is in red:

## $\texttt{vtm} = \begin{array}{c} \texttt{11011011011101110110} \\ \texttt{vtm} = \texttt{012021012102012021020121} \cdots \end{array}$

The Pansiot encoding is in red:

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

```
\texttt{vtm} = \begin{matrix} \texttt{110110} & \cdots \\ \texttt{01} \\ \uparrow \end{matrix}
```

```
\texttt{vtm} = \begin{matrix} \texttt{110110} & \cdots \\ \texttt{01} \\ \uparrow \end{matrix}
```

The 1 of the Pansiot encoding shows that the indicated digit is not a 0.

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

```
\texttt{vtm} = \begin{array}{c} \texttt{110110} & \cdots \\ \texttt{011} \\ \texttt{\uparrow} \end{array}
```

The 1 of the Pansiot encoding shows that the indicated digit is not a 0. It cannot be a 1, or we get the square 11.

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

$$vtm = 012$$

The 1 of the Pansiot encoding shows that the indicated digit is not a 0. It cannot be a 1, or we get the square 11. Therefore it is a 2.

```
\texttt{vtm} = \begin{array}{c} \texttt{110110} & \cdots \\ \texttt{012} \\ \uparrow \end{array}
```

$$vtm = 012^{110110}$$

The 1 of the Pansiot encoding shows that the indicated digit is not a 1.

$$vtm = 0122$$

The 1 of the Pansiot encoding shows that the indicated digit is not a 1. It cannot be a 2, or we get the square 22.

イロト イポト イヨト イヨト

```
vtm = \begin{array}{c} 110110 \\ 0120 \\ \uparrow \end{array}
```

The 1 of the Pansiot encoding shows that the indicated digit is not a 1. It cannot be a 2, or we get the square 22. Therefore, it is a 0.

< ロ > < 同 > < 回 > < 回 >

```
vtm = 0120
```

The 0 of the Pansiot encoding shows that the indicated digit is a 2.

$$vtm = 01202$$

The 0 of the Pansiot encoding shows that the indicated digit is a 2.

#### Definition

A word of the form xyx,  $xy \neq \epsilon$  is a k power, where k = |xyx|/|xy|. An r+ power is a k power, some k > r. Define the repetitive threshold function to be

 $RT(n) = \sup\{r : \text{ every infinite word over } \Sigma_n \text{ contains an } r + \text{ power}\}.$ 

### Theorem (Dejean's conjecture)

The repetitive threshold function is given by

$$RT(n) = \begin{cases} 2, & n=2\\ 7/4, & n=3\\ 7/5, & n=4\\ n/(n-1), & n \ge 5 \end{cases}$$

This was established via the work of many people, notably Carpi, who resolved all but finitely many cases.

#### Fix $n \ge 2$ , and let **w** be a threshold word over $\Sigma_n$ . Thus

$$\mathbf{w} = a_0 a_1 a_2 a_3 a_4 a_5 \cdots$$

where the  $a_i \in \Sigma_n$ , and **w** contains no r+ powers, where r = RT(n). The situation we saw with squarefree ternary words generalizes: Suppose ua is a factor of **w**, where |u| = n - 1, and  $a \in \Sigma_n$ . Because u doesn't contain any r+ power, the letters of u must be distinct. Further, either a is the first letter of u, or a does not occur in u.

### The Pansiot encoding of w is the sequence

$$\pi(\mathbf{w}) = b_0 b_1 b_2 b_3 b_4 b_5 \cdots$$

where

$$b_i = \left\{ egin{array}{cc} 0, & a_i = a_{i+n-1} \ 1, & ext{otherwise} \end{array} 
ight.$$

Word **w** can be recovered from its Pansiot encoding and its prefix of length n - 1.

• • • • • • • • • • • • •

Pansiot encodings allowed Dejean's conjecture to be resolved via constructions on binary alphabets, rather than by working on  $\Sigma_n$ . In published work on Dejean's conjecture, to recover information about *k* powers in **w** from the Pansiot encoding, group theory is used.

### $\texttt{vtm} = \begin{array}{c} \texttt{11011011011101110110}\\ \texttt{vtm} = \texttt{012021012102012021020121} \cdots \end{array}$

Long repeated factors in **w** correspond to long repeated factors in the Pansiot encoding.

### $\texttt{vtm} = \frac{1101101011011101110110}{0120210} \texttt{120210} \texttt{20120210} \texttt{20121} \cdots$

Long repeated factors in **w** correspond to long repeated factors in the Pansiot encoding.

## $\texttt{vtm} = \frac{1101101011011101110}{0120210} \texttt{121020120210} \texttt{20121} \cdots$

Long repeated factors in **w** correspond to long repeated factors in the Pansiot encoding.

# $\texttt{vtm} = \begin{matrix} \hline 11011 \\ 012021012102012021020121 \\ \cdots \end{matrix}$

The reverse is not true.

Pansiot encodings

▲ ■ ▶ ■ • つへの One World 12/46

# $\texttt{vtm} = \frac{110110101101110110}{0120210212021020121} \cdots$

The reverse is not true.

Pansiot encodings

▲ ■ ▶ ■ • つへの One World 12/46

#### 

The reverse is not true. The factor in  $\mathbf{w}$  is only repeated up to a permutation (switching 0 and 2).

Consider a length n - 1 factor u of  $\mathbf{w}$ ,  $u = a_0 a_1 \cdots a_{n-2}$  where the  $a_i$  are distinct letters of  $\Sigma_n$ . Let  $a_{n-1}$  be the unique letter in  $\Sigma_n - \{a_0, a_1, \dots, a_{n-2}\}$ . Consider the correspondence

$$u \stackrel{\varphi}{\to} \left(\begin{array}{ccc} 0 & 1 & \cdots & (n-2) & (n-1) \\ a_0 & a_1 & \cdots & a_{n-2} & a_{n-1} \end{array}\right)$$

which matches words and permutations.

Let  $u_i$  be the length n - 1 factor at index *i* in **w**. As before, let  $b_i$  be the *i*th letter of  $\pi(\mathbf{w})$ , the Pansiot encoding of **w**. Then

$$\varphi(\boldsymbol{u}_{i+1}) = \sigma(\boldsymbol{b}_i)\varphi(\boldsymbol{u}_i),$$

where

$$\sigma(0) = \begin{pmatrix} 0 & 1 & \cdots & (n-3) & (n-2) & (n-1) \\ 1 & 2 & \cdots & (n-2) & 1 & (n-1) \end{pmatrix}$$

and

$$\sigma(1) = \begin{pmatrix} 0 & 1 & \cdots & (n-3) & (n-2) & (n-1) \\ 1 & 2 & \cdots & (n-2) & (n-1) & 1 \end{pmatrix}$$

One World 14/46

In our example where n = 3 and  $\mathbf{w} = vtm = \underline{012021012}\cdots$ , we have  $u_0 = 01, u_3 = 02$ . Also  $\pi(\mathbf{w}) = 110110\cdots$ , and

$$\sigma(0) = \begin{pmatrix} 0 & 1 & 2 \\ 1 & 0 & 2 \end{pmatrix} = (0 \ 1); \sigma(1) = \begin{pmatrix} 0 & 1 & 2 \\ 1 & 2 & 0 \end{pmatrix} = (0 \ 1 \ 2)$$

and

$$\varphi(u_0) = \begin{pmatrix} 0 & 1 & 2 \\ 0 & 1 & 2 \end{pmatrix} = (); \varphi(u_3) = \begin{pmatrix} 0 & 1 & 2 \\ 0 & 2 & 1 \end{pmatrix} = (1 \ 2)$$

Thus  $\sigma(0)\sigma(1)\sigma(1)\varphi(u_0) = (0,1)(0,1,2)(0,1,2)() = (1 \ 2) = u_3.$ 

< 口 > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

Let  $\sigma$  be the antimorphism on  $\Sigma_2$  generated by  $\sigma(0), \sigma(1)$ . If **b**<sub>m</sub> is the prefix of  $\pi(\mathbf{w})$  of length *m*, then

$$\varphi(\boldsymbol{u}_m) = \sigma(\mathbf{b}_m)\varphi(\boldsymbol{u}_0).$$

A power *xyx* in **w**, of period |xy| and length *xyx* corresponds to a power  $\pi(xyx)$  in  $\pi(\mathbf{w})$ , of period |xy| and length |xyx| - (n - 1). If  $|x| \ge n - 1$ , then  $\sigma(\pi(xy))$  must be the identity permutation. We call  $\pi(xyx)$  a kernel repetition in  $\pi(\mathbf{w})$  (since  $\pi(xy)$  is in the kernel of  $\varphi$ ). Dejean's conjecture was solved by constructing binary sequences avoiding short repetitions (with |x| < n - 1) and kernel repetitions.
If power *xyx* in **w** has period *p* and length *m*, then  $\pi(xyx)$  has period *p* and length m - (n - 1). If  $|x| \ge n - 1$ , then  $\sigma(\pi(xy)) = ()$ , the identity element of the permutation group  $S_n$ . For fixed *n*, rather than working in  $S_n$ , we can consider the Cayley

graph of  $S_n$  with generators  $\sigma(0)$  and  $\sigma(1)$ .

If power *xyx* in **w** has period *p* and length *m*, then  $\pi(xyx)$  has period *p* and length m - (n - 1). If  $|x| \ge n - 1$ ,  $\sigma(\pi(xy))$  labels a closed walk in the Cayley graph. This Cayley graph is well-known to us under an alias; it is isomorphic to the De Bruijn graph of length 2 factors of **w**.

Figure: De Bruijn graph (with Pansiot encoding edge labels)

• • • • • • • • • • • •

# Parsing Pansiot encodings

One verifies that the Pansiot encoding of an infinite threshold word **w** cannot contain 00 or 1111 as a factor. It follows a final segment of  $\pi(\mathbf{w})$  has the form  $\pi(\mathbf{w}) = f(\mathbf{v})$  where

$$\begin{array}{rcl} f(1) &=& 01 \\ f(2) &=& 011 \\ f(3) &=& 0111 \end{array}$$

# Parsing Pansiot encodings (continued)

We consider again the alphabet  $\Sigma_3$ . We form a graph  $\mathcal{G}$  on the vertices of the previous graph: For each  $\alpha \in S = \{1, 2, 3\}$ , and for each vertex *xy*, introduce an edge from *xy* to *zw*, labeled by  $\alpha$ , exactly when *zw* is the endpoint of the walk in the previous graph labeled by  $f(\alpha)$  starting at *xy*. Thus  $U \in S^*$  labels a closed walk on  $\mathcal{G}$ , exactly when f(U)labels a closed walk on on the previous graph.

# Parsing Pansiot encodings (continued)

#### Figure: Graph G

Pansiot encodings

One World 23/46

Thue studied finite, right-infinite, doubly-infinite, and circular words avoiding powers. The last two types of words are more structurally uniform than the first two, since there are no ends where 'unsustainable' behaviours can take place. Thue characterized the overlap-free circular binary words.

A lot of work has been done on 'linear' words avoiding patterns. Many questions are open regarding circular words.

・ ロ ト ・ 同 ト ・ 三 ト ・ 三 ト

Once an infinite word avoiding some pattern exists, finite linear words of every length obviously exist. The situation is different for circular words. For example, no circular binary overlap free word of length 5 exists.

The following conjecture appears to be due to R. Jamie Simpson:

#### Theorem

There are ternary circular square free words of length n for every n except n = 5, 7, 9, 10, 14 and 17.

This was solved in 2002, using an approach which has become typical in combinatorics on words: It was shown that such words exist for every  $n \ge 180$ , and then a computer search establishes the result. In 2010, Shur gave a computer-free proof of this result, relying on a variation of Pansiot encoding.

Given a word  $w = u_1 u_2 \cdots u_m$ ,  $u_m \in \Sigma_n$ , the circular word [w] is the set of conjugates of w. It is natural to think of [w] as consisting of the letters of w arranged in a circle or 'necklace'. Equivalently, we may consider the indices i of the letters of a circular word  $[u] = [u_1 u_2 \cdots u_n]$ to belong to  $\mathbb{Z}_n$ , the integers modulo n. Thus  $u_{n+1} = u_1$ , for example.

・ロト ・日下 ・ ヨト ・

The Pansiot encoding of 202101 is 011011 = f(22). In the circular word,  $u_0u_1 = 01 = u_6u_7$ , so that we have  $\sigma(011011) = ()$ . Put another way, 011011 gives a closed walk on our De Bruijn graph, and 22 labels a closed walk on  $\mathcal{G}$ . Parsing Pansiot encodings by *f* means we deal with words only 1/3 as long.

< 回 > < 三 > < 三 >

## Theorem (Shur 2010)

If w labels a closed walk on  $\mathcal{G}$ , then [f(w)] is the Pansiot encoding of a square-free circular word if

- [w] has no factor 11, 222, 223, 322, or 333
- [w] has no factor UxyU with Uxy a closed walk,  $|U| \ge 2, x, y \in \{1, 2, 3\}$ .

This is not quite if and only if: for example, word 0102 has Pansiot encoding 0101 = f(11)

Call a word *w* over  $\Sigma_n$  level if  $|w|_i - |w|_j \in \{-1, 0, 1\}$  for  $i, j \in \Sigma_n$ . Call a word *w* over  $\Sigma_2$  an FS word if the only square factors of *w* are 00, 11 and 0101.

Jesse Johnson used Shur's approach to prove these results in his MSc thesis:

#### Theorem (Johnson, 2020)

There are level ternary circular square free words of length n for every n except n = 5, 7, 9, 10, 14 and 17.

#### Theorem (Johnson, 2020)

There are circular FS words of every length.

#### Remark

Level words are useful when we care about the length of constructed words: If  $w \in \sum_{n}^{kn}$  is level, then for any morphism g, word g(w) has length k|g|. Level words can be used analogously to k-uniform morphisms, where the image of word u has length k|u|.

Call *xyz* an undirected *k* power if  $z \in \{x, x^R\}$ , and |xyx|/|xy| = k. Thus *reenter* is an undirected 7/5 power, and so is *stalest*. If we required instead that *z* was an anagram of *x*, we would have an **Abelian power**, in the sense used by Cassaigne & C. (1999). One can also see undirected powers as a common generalization of gapped repeats and gapped palindromes.

< 口 > < 同 > < 回 > < 回 > < 回 > <

#### The undirected repetition threshold function is defined to be

 $URT(k) = \inf\{r : \text{ undirected } r \text{-powers are avoidable on } k \text{ letters.}\}$ 

Theorem (Mol &C., 2019) For k = 4, 5, ..., 21, we have

$$URT(k)=\frac{k-1}{k-2}.$$

Avoiding gapped palindromes  $xyx^R$  where |x| > 1 is rather easy; for example  $(123)^{\omega}$  contains no such gapped palindrome. We will therefore focus on the issue of constructing words over  $\Sigma_k$  avoiding ordinary (k-1)/(k-2)+ powers.

# Dejean's conjecture revisited

Suppose **w** is a word of  $\Sigma_k^{\omega}$  that avoids r+ powers for some fixed r. Consider first the case of Dejean's conjecture, where we are interested in r = k/(k-1). In this case, factors of **w** of length k - 1 must contain k - 1 distinct letters; otherwise **w** contains a power of exponent at least (k-1)/(k-2) > k/(k-1).

# Dejean's conjecture revisited (continued)

Suppose that  $pa_1a_2 \cdots a_k$  is a prefix of **w**, where the  $a_i \in \Sigma_k$ . The letters of  $\{a_2, a_3 \cdots a_k\}$  must be distinct. It follows that  $a_k$  is one of the two letters in  $\Sigma_k - \{a_2, a_3, \dots, a_{k-1}\}$ . Of these two letters, the one occurring closest to the end of  $pa_1a_2 \cdots a_{k-1}$  is  $a_1$  (because the letters of  $\{a_1, a_2 \cdots a_{k-1}\}$  must be distinct).

The Pansiot encoding may be constructed by scanning prefixes of **w**, starting with the length *k* prefix: When we scan  $pa_1a_2 \cdots a_k$ , we afix 0 to the Pansiot encoding if  $a_k$  equals the letter of  $\sum_k - \{a_2, a_3, \ldots, a_{k-1}\}$  closest to the end of  $pa_1a_2 \cdots a_{k-1}$ ; we afix 1 if  $a_k$  equals the letter of  $\sum_k - \{a_2, a_3, \ldots, a_{k-1}\}$  second closest to the end.
## A Pansiot-like encoding

Now consider the case r = (k - 1)/(k - 2), as in the undirected powers problem. In this case, factors of **w** of length k - 2 must contain k - 2 distinct letters; otherwise **w** contains a power of exponent at least (k - 2)/(k - 3) > (k - 1)/(k - 2).

イロト イ団ト イヨト イヨト

## A Pansiot-like encoding (continued)

Suppose that  $pa_1a_2 \cdots a_{k-1}$  is a prefix of **w**, where the  $a_i \in \Sigma_k$ . The letters of  $\{a_2, a_3 \cdots a_{k-1}\}$  must be distinct. It follows that  $a_{k-1}$  is one of the three letters in  $\Sigma_k - \{a_2, a_3, \dots, a_{k-2}\}$ . Of these three letters, the one occurring closest to the end of  $pa_1a_2 \cdots a_{k-2}$  is  $a_1$  (because the letters of  $\{a_1, a_2 \cdots a_{k-2}\}$  must be distinct).

A Pansiot-like encoding **b** may be constructed by scanning prefixes of **w**, starting with the length k - 1 prefix: When we scan  $pa_1a_2 \cdots a_{k-1}$ , we afix 0 to the Pansiot encoding if  $a_{k-1}$  equals the letter of

 $\Sigma_k - \{a_2, a_3, \dots, a_{k-2}\}$  closest to the end of  $pa_1a_2 \cdots a_{k-2}$ ; we afix 1 if  $a_k$  equals the letter of  $\Sigma_k - \{a_2, a_3, \dots, a_{k-2}\}$  second closest to the end; we afix 2 if  $a_k$  equals the letter of  $\Sigma_k - \{a_2, a_3, \dots, a_{k-2}\}$  third closest to the end.

ヘロト 不通 ト イヨト イヨト ニヨー

## A Pansiot-like encoding (continued)

There are some technical issues at the very start, where the question of 'second closest' versus 'third closest' is undefined. One can either introduce a tie-breaking convention, or alter the encoding, to start with the first prefix of **w** containing all letters of  $\Sigma_k$ . Let the encoding be

$$\mathbf{b}=b_0b_1b_2b_3\cdots$$

< ロ > < 同 > < 回 > < 回 >

Consider a prefix  $P = pa_1a_2 \cdots a_{k-1}$  of **w**, where the  $a_i$  are distinct letters of  $\Sigma_k$ . Consider the correspondence

$$P \stackrel{\varphi}{\to} \left( \begin{array}{cccc} 0 & 1 & 2 & 3 \cdots & (k-2) & (k-1) \\ r_3 & r_2 & a_1 & a_2 \cdots & a_{k-3} & a_{k-2} \end{array} \right)$$

where  $r_3$  is the letter of  $\Sigma_k - \{a_2, a_3, \dots, a_{k-2}\}$  third closest to the end of  $pa_1a_2 \cdots a_k$ , and  $r_2$  is the letter of  $\Sigma_k - \{a_2, a_3, \dots, a_{k-2}\}$  second closest to the end of  $pa_1a_2 \cdots a_k$ .

< ロ > < 同 > < 回 > < 回 >

Let  $u_i$  be the prefix of **w** of length i + k - 1. Then

$$\varphi(\boldsymbol{u}_{i+1}) = \sigma(\boldsymbol{b}_i)\varphi(\boldsymbol{u}_i),$$

where

$$\sigma(0) = \begin{pmatrix} 0 & 1 & 2 & 3 & \cdots & (k-3) & (k-2) \\ 0 & 1 & 3 & 4 & \cdots & (k-2) & 2 \end{pmatrix},$$
  
$$\sigma(1) = \begin{pmatrix} 0 & 1 & 2 & 3 & \cdots & (k-3) & (k-2) \\ 0 & 2 & 3 & 4 & \cdots & (k-2) & 1 \end{pmatrix}$$

and

$$\sigma(0) = \begin{pmatrix} 0 & 1 & 2 & 3 & \cdots & (k-3) & (k-2) \\ 1 & 2 & 3 & 4 & \cdots & (k-2) & 0 \end{pmatrix}$$

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

Let  $\sigma$  be the antimorphism on  $\Sigma_3$  generated by  $\sigma(0), \sigma(1), \sigma(2)$ . If **b**<sub>m</sub> is the prefix of  $\pi(\mathbf{w})$  of length *m*, then

$$\varphi(\boldsymbol{u}_m) = \sigma(\mathbf{b}_m)\varphi(\boldsymbol{u}_0).$$

We are again led to avoiding short repetitions and kernel repetitions.

## Pansiot encodings are unnecessary!

The constructions in the solutions to Dejean's conjecture use binary fixed points of D0Ls. These are Pansiot encodings, and are decoded into words of  $\Sigma_n^{\omega}$ . From a formal point of view, the words witnessing the correctness of Dejean's conjecture are thus transductions of D0L sequences.

#### Theorem (Dekking, 1994 (Theorem 7.9.1 in Allouche & Shallit)) The transduction of an HD0L sequence is an HD0L sequence.

Thus witnesses to Dejean's Conjecture can be given directly by HD0Ls.

## Points in favour of Pansiot encodings

- Attacking threshold problems via encodings unifies questions involving multiple alphabets.
- Carpi's contribution involved group theory in an important way, implying that the group viewpoint is necessary.
- In the case of squarefree words, encodings (and the parsing function *f*) reduce the depth of searches by 1/3.

< ロ > < 同 > < 回 > < 回 > < 回 >

## Some open problems

- Recast Carpi's group-theoretic work via De Bruijn graphs. Does this give further insight?
- **2** Prove that  $URT(k) = \frac{k-1}{k-2}$  for all  $k \ge 4$ .
- Generalize classical pattern avoidance results to circular words.
