Theorem

The three following tilings are mutually locally derivable

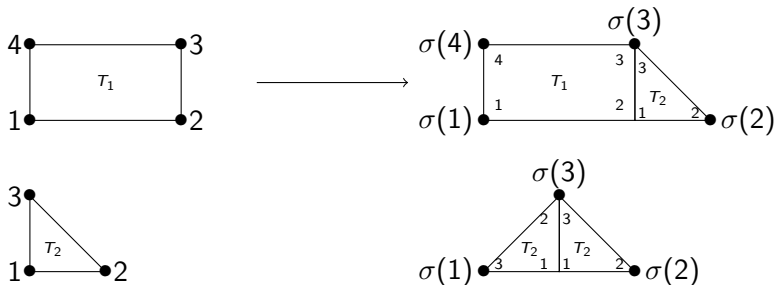

- ▶ *Tiling by the topological substitution.*
- ▶ *Tiling by the stepped surface.*
- ▶ *Tiling by the Rauzy fractal.*

Theorem

The sequence of renormalized patches $(\sigma^n(C))_{n \in \mathbb{N}}$ is convergent for the Gromov-Hausdorff topology.

Pre-substitution

- ▶ Cellular complex. Topological polygons
 $\mathcal{T} = \{T_1, \dots, T_d\}$.
- ▶ Patches $\sigma(T_i), i = 1 \dots d$.
- ▶ $(\mathcal{T}, \sigma(\mathcal{T}), \sigma)$.

A topological substitution is a pre-substitution such that

- ▶ can be iterated on a tile T
- ▶ $\sigma^n(T)$ has non empty core for each integer n .

Under hypothesis we can define

$$\sigma^\infty(T) = \bigcup_{k=0}^{\infty} \sigma^k(T).$$

By construction, the complex $\sigma^\infty(T)$ is homeomorphic to $\mathbb{R}^2$.

Results

Topological
substitution

Substitution

Rauzy fractal

Stepped plane

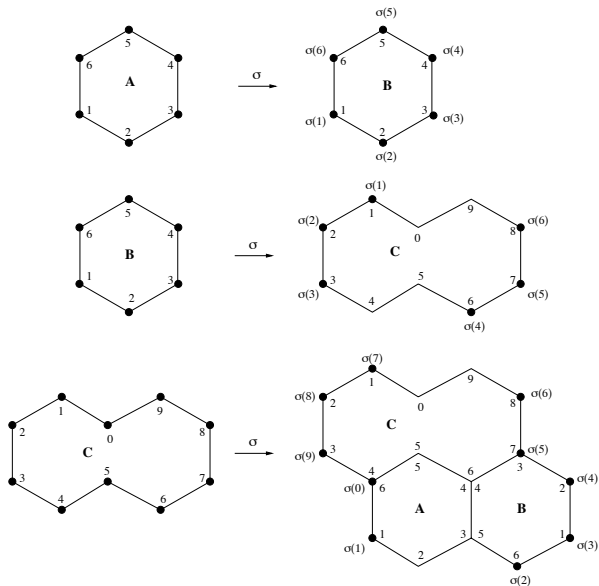

Proof

A tiling of $\mathbb{R}^2$ naturally defines a 2-complex.

Definition

A tiling of the plane $\mathbb{R}^2$ is **substitutive** if the labelled complex associated to it can be obtained by inflation from a topological substitution.

Results

Topological
substitution

Substitution

Rauzy fractal

Stepped plane

Proof

Matrix of the abelianization of σ is $M_\sigma = \begin{pmatrix} 1 & 1 & 1 \\ 1 & 0 & 0 \\ 0 & 1 & 0 \end{pmatrix}$.

- ▶ Eigenvalue $\beta > 1$. Eigenvector v_β .
- ▶ Eigenvalue $\alpha \in \mathbb{C}, |\alpha| < 1$. Eigenspace: Plane P_α .
- ▶ Let us denote π_β the projection on P parallel to v_β .
- ▶ Let us denote I the abelianization map:
 $I : \{a, b, c\}^* \rightarrow \mathbb{Z}^3$.

Theorem (Rauzy)

There exists a compact set $\mathcal{R}$ in $P \sim \mathbb{R}^2$ and three subsets $\mathcal{R}_a, \mathcal{R}_b, \mathcal{R}_c$ such that

- ▶ $\mathcal{R}_j = \overline{\{\pi_\beta I(u_0 \dots u_{i-1}), u_i = j\}}$ for $j = a, b, c$.
- ▶ $\mathcal{R} = \overline{\{\pi_\beta I(u_0 \dots u_{i-1})\}}$
- ▶ *There exists a similitude $h : \mathbb{R}^2 \rightarrow \mathbb{R}^2$, such that:*
$$\begin{cases} \mathcal{R}_a = h\mathcal{R}_a \cup h\mathcal{R}_b \cup h\mathcal{R}_c \\ \mathcal{R}_b = h\mathcal{R}_a + \pi_\beta I(a) \\ \mathcal{R}_c = h\mathcal{R}_b + \pi_\beta I(a) \end{cases}$$
- ▶ *The compact set $\mathcal{R}$ tiles the plane in an aperiodic way.*

Results

Topological
substitution

Substitution

Rauzy fractal

Stepped plane

Proof

- ▶ The Rauzy fractal is solution of a **iterated function system**.

$$\mathcal{R} = h\mathcal{R} \bigcup h^2\mathcal{R} + \pi_\beta l_a \bigcup h^3\mathcal{R} + h\pi_\beta l_a + \pi_\beta l_a$$

- ▶ There is also a periodic tiling of the plane by this Rauzy fractal.

For $x \in \mathbb{Z}^3$ we define

$$(x, i^*) = \{x + e_i + \sum_{j \in \{a,b,c\}} \lambda_j e_j, \lambda_j \in (0;1), j \neq i\}$$

$$E_1^*(\sigma)(x, i^*) = \sum_{\substack{j \in \{a,b,c\}, \\ p.i.s = \sigma(j)}} (M_\sigma^{-1}(x - l(p)), e_j^*).$$

For example

- ▶ a belongs to $\sigma(a), \sigma(b), \sigma(c)$.
- ▶ b belongs to $\sigma(a)$.
- ▶ c belongs to $\sigma(a)$.

Theorem (Arnoux-Ito)

Define K as the set $\bigcup_{i \in \{a,b,c\}} (-e_i, i^*)$.

- ▶ The sequence $(\pi_P \circ E_1^*(\sigma)^n(K))_{n \in \mathbb{N}}$ converges to a tiling of $\mathcal{P}$.
- ▶ The following limit exists for the Hausdorff convergence:

$$\lim_n E_0(\sigma)^n(D_n)$$

where $D_n = \pi_\beta \circ E_1^*(\sigma)^n(K)$. Moreover this limit is equal to the Rauzy fractal $\mathcal{R}$.
