

Two numerical test cases of diffusion equations

Porquerolles; June, 22th-24th 2009.

Contents

- 1 Strong jump of anisotropy
- 2 Convection-diffusion problem (Ern-Stephansen-Zunino)

Contents

- 1 Strong jump of anisotropy
- 2 Convection-diffusion problem (Ern-Stephansen-Zunino)

Equation and data

$$\begin{cases} -\operatorname{div}(\Lambda \nabla u) = f & \text{in } \Omega = (0, 1)^2, \\ u = 0 & \text{on } \partial\Omega \end{cases}$$

Diffusion:

$$\Lambda(x, y) = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} \quad \text{if } x < 0.5,$$

$$\Lambda(x, y) = \begin{pmatrix} D & 0 \\ 0 & 1 \end{pmatrix} \quad \text{if } x > 0.5$$

with D large.

Exact solution:

$$u(x, y) = x(1 - x)y(1 - y).$$

Minimum = 0; maximum = 6.25E-2.

HMM scheme, cartesian grid

HMM = Mimetic Finite Difference = Hybrid Finite Volume = Mixed Finite Volume

Grid: 50×50 regular cartesian grid (2500 cells, $h=2.83\text{E-}2$).

Results:

► $D = 1\text{E-}3$

L^2 errors: $5.6\text{E-}4$ (u), $7.3\text{E-}4$ (∇u)
min= $9.9\text{E-}5$, max= $6.247\text{E-}2$

► $D = 1\text{E-}4$

L^2 errors: $5.6\text{E-}4$ (u), $8.6\text{E-}4$ (∇u)
min= $9.9\text{E-}5$, max= $6.247\text{E-}2$

HMM scheme, non-aligned

Grid: 50×50 reproductions by symmetry of this pattern (7500 cells, $h=2.24\text{E-}2$).

Results:

► $D = 1\text{E-}3$

L^2 errors: $6.1\text{E-}2$ (u), $4\text{E}0$ (∇u)
min= $4.9\text{E-}5$, max= $6.8\text{E-}2$

► $D = 1\text{E-}4$

L^2 errors: $6.1\text{E-}1$ (u), $4\text{E}1$ (∇u)
min= $4.9\text{E-}5$, max= 0.12

G-scheme, non-aligned

Grid: 50×50 reproductions by symmetry of this pattern (7500 cells, $h=2.24\text{E-}2$).

Results:

► $D = 1\text{E-}3$

L^2 errors: $1.4\text{e-}3$ (u), $1.9\text{E-}2$ (∇u)
min= $2.45\text{E-}6$, max= $6.248\text{E-}2$

► $D = 1\text{E-}4$

$1.4\text{E-}3$ (u), $3\text{E-}2$ (∇u)
min= $2.45\text{E-}6$, max= $6.248\text{E-}2$

G-scheme, non-aligned

Grid: 50×50 **two different** reproductions of this pattern (7500 cells, $h=2.24\text{E-}2$).

Results: with $D = 1\text{E-}4$

Reproduction by symmetry

L^2 errors: $1.4\text{e-}3$ (u), $3\text{E-}2$ (∇u)
min= $2.45\text{E-}6$, max= $6.248\text{E-}2$

Reproduction by translation

$3.5\text{E-}1$ (u), $2.8\text{E}0$ (∇u)
min= $4.9\text{E-}5$, max= $1.1\text{E-}1$

Contents

1 Strong jump of anisotropy

2 Convection-diffusion problem (Ern-Stephansen-Zunino)

Equation and data

$$\begin{cases} -\operatorname{div}(\Lambda \nabla u) + \operatorname{div}(Vu) + u = f & \text{in } \Omega = (0, 1)^2, \\ u = 0 & \text{on } \partial\Omega \end{cases}$$

Diffusion: Λ is diagonal
with coefficients:

Convection: strong and rotating:

$$V(x, y) = (40x(2y - 1)(x - 1), -40y(2x - 1)(y - 1))$$

Source term: volcano: $f(x, y) = 10^{-2} \exp(-(r - 0.35)^2/0.005)$
with $r = \operatorname{dist}((x, y), (0.5, 0.5))$.

“Exact” solution

min=0, max \approx 6.7E-4

HMM scheme, 60×60 cartesian grid ($h = 2.36E - 2$)

Centered convection

min= $1.8E-7$, max= $6.97E-4$

Cell upwind

min= $3.7E-7$, max= $6.41E-4$

Edge upwind

min= $3.7E-7$, max= $6.45E-4$

Recall:

true min=0,

true max $\approx 6.7E-4$

HMM scheme, 60×60 previous patterns ($h = 1.86E - 2$)

Centered convection

min=-4.7E-4, max=1.4E-3

Cell upwind

min=-1.55E-7, max=7.9E-4

Edge upwind

min=3.3E-8, max=6.62E-4

Recall:

true min=0,

true max \approx 6.7E-4
